Plants are universally recognised as a vital part of the world's natural heritage and an essential resource for the planet. They are the key component for the global sustainability. Besides the plants that we use for our food, fibres, fuel, cloth and shelter, a vast number of wild plants provide important medicines, especially in developing countries for their traditional health systems. There is considerable demand from the organised industrial sector for raw material of medicinal plants and it is increasing year after year. The user group at various levels are now conscious of the decline in availability and factors like short supply, high prices and forced substitution of certain species. In fact, survival of many of these plants is threatened because they are destructively harvested for root/rhizome/tuber or used as whole plant and not being cultivated elsewhere. There is thus urgent need to create greater awareness among the population as a whole, particularly among the farmers, about the medicinal and economic value of these plants, so that this heritage can be used and exploited wisely and at the same time conserved and perpetuated through judicious management for future generations.

Proper marketing starts with linking the resource and product development to market preferences. In sustainable forestry, the role of marketing is to create effective linkages between resource managers, processors, and the end users.

NWFPs are sold in various markets: local, urban, regional, state, national and international. Each market place also involves different influencing factors relating to the product, promotion and price. Marketing for medicinal plants is inefficient, informal, secretive and opportunistic. As a result the raw material supply is shaky, unsustainable and exploitative. This results in depletion of resource base, exploitation of rural people, adulteration and non-available of quality herbal drugs for domestic and global consumption and trade.

A clear understanding of both the supply and demand factors is a vital step towards planning for both the conservation and sustainable use of the habitats of these plants as well as ensuring continued availability of the basic ingredients used to address needs of the people. In view of this a market survey for demand and supply of medicinal plants is being undertaken. A proforma was developed for annual requirement of medicinal plants traded in various Districts of Rajasthan.

The main objective of the study was to assess requirement of medicinal plants in Rajasthan. Manufacturers account for over 90% of demand. For the estimation of demand, manufacturing units were contacted in various Districts of Rajasthan. A list of 435 Ayurvedic drug manufacturing units and firms/persons involved in trading of

medicinal plants in Rajasthan has been developed with the help of Directorate of Ayurveda, Government of Rajasthan. Since all manufacturing units/traders are not a homogenous group, they all fall in different categories. Therefore, each unit/ trader was visited for real and genuine data collection for market survey.

The quality of data has to be assessed in view of the problems faced by the investigator in collecting the data. In collecting the desired information, the survey team had to depend on goodwill and cooperation of respondents. Repeat visits had to be made to get the information. Also lot of persuasion had to be used. AFRI had written several letters to all manufacturing units for providing information. Their response has not been as desired. Many units, in spite of best efforts, data for all the plants used by the unit was rarely made available. Almost all units have been very diffident in providing information with regards to their inputs and outputs.

The trained staff has done the survey. They were given proper training for the conduct of the survey as well as all relevant information. Over all data does present a picture on domestic consumption of medicinal plants in Rajasthan. These data would be of great use in understanding as well as for furtherance of role of Ayurveda sector in the State.

**Market survey and Data collection:** We have surveyed 435 units/ traders involved in the trading of medicinal plants in 26 districts of Rajasthan. The list of traders involved in the trading of medicinal plants and addresses of traders which are not dealing anymore in the trading or switched over to other trading or untraceable or not provided any information has been incorporated in the Annexure-1. The amount of medicinal plants traded annually and number of plants required by various traders of each District has also been incorporated in the Annexure-1. Out of various units involved only 170 (39%) units have responded and 265 (61%) units either found closed, untraceable or switched over to other trading business and they are not dealing any more in medicinal plants (Table 1). Few have declined to give their information and few after repeated request have not submitted their requirement. Maximum number of trading units (136) was found in Jaipur followed by Udaipur (48), Jodhpur (31), Kota (28), Sikar (22) and Ajmer & Alwar (21) of each. Banswara District has only one unit (Table 1).

Table 2 showed top 20 traders of medicinal plants along with their requirements and number of plants traded annually. The traders are distributed in Ajmer, Jaipur, Udaipur, Jodhpur, Ganganagar and in Sirohi. These traders account for more than 67 percent of the total annual trade.

The total requirement of surveyed districts revealed that 9,36,110kg of various medicinal plants is traded annually. Jaipur tops among the surveyed districts with 27.24% trading of medicinal plants followed by Jodhpur (16.54%), Ajmer (14.12%), Bhilwara (9.91%), Udaipur (8.98%) and Sri Ganga Nagari (4.58%). The trade share of Banaswara is only 0.002% of the total trade (Table 1).

More than 240 medicinal plants belonging to 93 families, 211 genera and 242 plant species are being traded annually in surveyed Districts of Rajasthan (Annexure-2). Out of 93 families traded, 49 were monogeneric with 1-5species and 42 families were monogeneric and mono species (Table 3). The highest trading was for

Euphorbiaceae (1,15,464kg/year) followed by Caesalpiniaceae (97,589kg/year) and Anacardiaceae (72,658kg/year). The requirement of Nyctanthaceae was only 4kg/year followed by Juncaceae and Ephedraceae (50kg/year) of each. Asteraceae with 13 genera and 13 species is highly represented but its demand is only for 12,357kg/year followed by Papilionaceae 11 genera and 11 families with 42,223kg/year demand. The demand of top 10 families was 5,87,149 kg per year, which was 62.7% of the total trade (Table 3).

The highest trade was for *Embllica officinalis* Gaertn. (1,11,016 kg) followed by *Cassia angustifolia* Vahl. (85,395kg) and *Mangifera indica* Linn. (72,045kg). Top 20 plants accounts for 68.65 percent of the total trade (Table 4). The requirement of State Rasauyanshalas situated in Ajmer, Bharatpur, Jodhpur and Udaipur was for 21 medicinal plants with total quantity of 30,197 kg, which is just 3.22% of the total trade in the State (Table 5).
